U.C. COOPERATIVE EXTENSION

SAMPLE COST TO ESTABLISH AND PRODUCE

LEAF LETTUCE

IMPERIAL COUNTY – 2000

Prepared by: Keith S. Mayberry Farm Advisor, U.C. Cooperative Extension, Imperial County

For an explanation of calculations used for the study refer to the attached General Assumptions or call the author, Keith S. Mayberry, at the Imperial County Cooperative Extension office, (619)352-9474 or e-mail at <u>ksmayberry@ucdavis.edu</u>.

The University of California Cooperative Extension in compliance with the Civil Rights Act of 1964. Title IX of the Education Amendments of 1972, and the Rehabilitation Act of 1973 does not discriminate on the basis of race, creed, religion, color, national origins, or mental or physical handicaps in any of its programs or activities, or with respect to any of its employment practices or procedures. The University of California does not discriminate on the basis of age, ancestry, sexual orientation, marital status, citizenship, medical condition (as defined in section 12926 of the California Government Code) or because the individuals are disabled or Vietnam era veterans. Inquiries regarding this policy may be directed to the Personnel Studies and Affirmative Action Manager, Agriculture and Natural Resources, 2120 University Avenue, University of California, Berkeley, California 94720, (510) 644-4270.

University of California and the United States Department of Agriculture cooperating.

FOREWORD

We wish to thank growers, pest control advisors, seed companies, transplant producers, contract harvesters, fertilizer dealers, and equipment companies for providing us with the data necessary to compile this circular. Without them we could not have achieved the accuracy needed for evaluating the cost of production for the dynamic and important vegetable industry in Imperial County.

The information presented herein allows one to get a "ballpark" idea of vegetable production costs and practices in the Imperial County. They do not reflect the exact values or practices of any grower or shipper, but are rather an amalgamation of countywide prevailing costs and practices. Exact costs incurred by individual growers depend upon many variables such as weather, land rent, seed, choice of agrichemicals, location, etc. No exact comparison with individual grower practice is possible or intended. The budgets do reflect, however, the prevailing industry trends within the region.

Overhead usually includes secretarial and office expenses, supplies, donations, utilities, transportation, accountants, insurance, safety training, permits, etc. In most of the crop guidelines contained in this circular we used 13% of the total of land preparation, growing costs and land rent to estimate overhead. For crops that require additional labor or extra operations (i.e. leaf lettuce) we used 17% overhead to account for the additional expenses.

Since all of the inputs used to figure production costs are impossible to document in a single page, we have included extra expense in man-hours or overhead to account for such items as pipe setting, motor grader, water truck, shovel work, etc. Whenever possible we have given the costs of these operations per hour.

Not included in these production costs are expenses resulting from management fees, loans, supervision, or return on investments. The crop budgets also do not contain expenses encumbered for cleanup discing, road and ditch maintenance, perimeter weed control. If all the above items were taken into account, the budget may need to be increased by 7-15%.

Annual acreage, yield, and gross value of leaf lettuce per acre in Imperial County, CA (1995-1999)

*25 lb cartons (leaf and butter), 40 lb cartons (Romaine)

Source: Imperial County Agricultural Commissioner's Reports 1995-1999

YIELDS The term "leaf lettuce" includes greenleaf, redleaf, butter, and romaine (cos) types. Some lettuce growers plant endive, escarole, nappa and bok choy in the same fields as leaf lettuce. Each type has a different yield potential, but yields of 500 to 1300 cartons per acre are normal.

VARIETIES Royal Green *Peto*; Shining Star *Genecorp*; Genecorp Green *Genecorp*; Green Vision *Central Valley Seeds;* Waldman's Green *Various*; and Two Star *Orsetti*; redleaf varieties are Deep Red *Harris Moran*; Big Red *Genecorp*; New Red *Synergene*; Red Tide *Genecorp*; Vulcan *Sakata*. Butterhead varieties are Dark Green Boston *various*; Optima *Vilmorin;* Esmeralda *Peto*; Verian *Novartis*; and Encore *Peto*; romaine varieties are Paris Island Cos *various*; King Henry *Progeny;* Apache *Greengenes*; King Louie *Paragon*; Darkland Cos *Central Valley* and Green Towers *Harris Moran*

PLANTING INFORMATION Some growers plant September 15 to December 5, while others concentrate mostly on October plantings. The crop is harvested December through February. The seed is normally planted at a 2- to 3-inch spacing within rows on 40 to 42 beds. There are 2 lines per bed normally 13 inches between lines. Lettuce is normally planted using pelleted seed and a precision planter. At a 2 inch spacing 157,000 (157 M) seed will be needed. Seed is planted ¹/₄ inch deep or less and sprinkler irrigated to emergence. After emergence, the field is converted to furrow irrigation. Plants are thinned to 6 to10 inches within the row depending upon variety.

The weather may still be relatively hot during early October. Leaf lettuce varieties are often subject to thermodormancy problems under these conditions. Primed seed should be used to avoid the problem or the initial irrigation should be started late in the afternoon so that the seed imbibe water and start to germinate during the cooler nighttime hours. Lettuce seed should not be planted into moist soil unless the sprinklers are started soon after planting. A delay of 10 to12 hours may cause germination to start and the seed to die before an irrigation is applied.

FERTILIZERS Five-hundred pounds of ammoniated phosphate 11-52-0 per acre are broadcast prior to listing the beds. Nitrogen is sidedressed just after thinning and during later growth stages. Early season lettuce requires less nitrogen than later planted lettuce. About 150 pounds of nitrogen (N) are used for the early season crop and 200 to 250 pounds N for late-season lettuce.

SOILS Silt loams and sandy soils are preferred. The lighter soils provide better drainage during cold weather and warm up more readily. Lettuce has a moderately low degree of salt tolerance. Excess salinity results in poor seed germination and small heads.

IRRIGATION Most growers use sprinkler irrigation for the first 5 to 7 days or until the seedlings emerge and the grower can "green line" the seed rows. The field is then converted to furrow irrigation for the remainder of the season.

Care must be taken not to oversaturate beds when growing early-season lettuce. Excess moisture favors the development of bottom rot (*Rhizoctonia solani*).

Gated pipe is also used, especially near harvest. The major benefits of gated pipe is to allow for uniform application of water down furrows and to maintain a dry head basin so that harvesting equipment can turn around on hard ground.

FERTILIZERS Five hundred pounds of 11-52-0 are usually broadcast prior to listing. Nitrogen is sidedressed just after thinning and during later growth. Early season lettuce requires less N than that grown in January and February. About 150 pounds N/ac are used early, while 200 to 250 pounds N/Ac are applied during cold weather.

Lettuce is very sensitive to overdoses of ammoniacal fertilizers. Seedling injury will be expressed by root burn, yellowing of the leaves, and even dead plants. Fertilizer injury later in the season is expressed by wilting of the outer leaves and a rusty reddish discoloration in the middle of the plant root.

PEST AND DISEASE CONTROL Insect pests include crickets, cutworms, leafminers, salt marsh caterpillars, and beet armyworms. Cabbage loopers can be especially serious after thinning. Aphids and thrips are late-season insect pests that should be controlled.

UC Cooperative Extension-Imperial County Vegetable Crops Guidelines Aug. 2000

Silverleaf whitefly can cause delayed maturity. A preplant application of systemic insecticide applied at planting is used for control.

Insects and their damage are more visible in the mixed lettuce types and may cause poor quality and bad arrivals.

Pest control is more difficult to manage when growing leaf lettuce as compared with growing head lettuce. Leaf lettuce is often planted in small, 8 to 20 bed blocks. There are often several plantings made on different dates in the same fields. Pesticide drift onto non-target crops is a difficult problem to manage.

The most serious diseases affecting leaf lettuce are lettuce big vein virus (LBVV), bottom rot (*Rhizoctonia solani*), grey mold (*Botrytis cinerea*) lettuce drop (*Sclerotinia sclerotiorum* and *S. minor*). Use mosaic-free seed (i.e., no virus in 30,000 seed) to prevent lettuce mosaic virus (LMV).

Powdery mildew (*Erysiphe cichoracearum*) may need to be controlled with sulfur applications to avoid economic damage.

Freeze injury on mature lettuce will be expressed as blistering and peeling of the epidermis, followed by browning of the tissues.

Tipburn is a physiological disorder caused by the lack of mobility of calcium in the leaves during warm weather and rapid growing conditions. There is presently no control of this condition.

All currently registered herbicides can also cause lettuce crop injury under certain conditions. Avoid high rates on sandy soils during hot weather.

HARVESTING Harvesting is done with ground pack crews (no machines). Leaf lettuce is hand-cut and harvested with 24 heads per carton. Weights per carton vary according to lettuce type. Redleaf, greenleaf, and butter lettuce weighs 25 pounds, and romaine cartons weigh 40 pounds. One-dozen count cartons are also offered. Romaine is occasionally packed in a "WGA crate" which contains 30 plants.

Leaf lettuce is almost always harvested to fill an order. A day's shipments would often include cartons of each lettuce type, hence, the word "mixed" is sometimes used to describe the operation. Napa, bok choy, endive, and escarole are often grown in the same fields.

The cartons are vacuum cooled or hydrovac processed and shipped to markets in refrigerated trucks.

UC Cooperative Extension-Imperial County Vegetable Crops Guidelines Aug. 2000

POSTHARVEST HANDLING Leaf lettuce is even more perishable than head lettuce and should be cooled immediately after harvesting. Cooled cartons should be stored just above freezing at 98 percent relative humidity.

For more information see "Leaf Lettuce Production in California", DANR Publication 7216 available from the Imperial County Cooperative Extension Office or for a free download from the Internet go to http://anrcatalog.ucdavis.edu/specials.ihtml
